At its best the fog will fill a 50gal garbage can or cabinet completely opaque and last for minutes if not disturbed. It will flow down a conference table, off the ends and start filling the floor in still air and high humidity. The fog will travel down a 50' hose once it saturates the inside.

At the other end of the scale in fast moving air or turbulence it dissipates in a foot or 2 due to mixing with the air. Right under a filter in an open room it does not last long. A few feet from the filter it can last up to 10'.

It will fill the box with no fan. With the fan it depends on the humidity of the air and speed. Our unit is basically a box with a fan so if the air flow is low it will still work.

Diffusers in general do not work very well because of the high velocity at the small holes and the mushroom turbulence. That is why we like the large dia. hose that can allow a good volume at low velocity.

We have built diffusers with internal baffles to balance everything for production machines. We make some vapor deposition machines with this technology. In a visualization application it has a very short flow length.

Jim
